Determining if a nucleic acid is a marker for a phenotype/ceil type of interest, by global comparison of expressed sequence tags known to be expressed in the phenotype/cell type with all ESTs expressed in normal tissue. Claim 23; Page 490-491; 516pp; English. The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a	0-MAY-2001; 2001US-0293999P. 2-CCT-2001; 2001US-0330457P. 9-FEB-2002; 2002US-0357144P. A method of the invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is useful for detecting the absence or presence of peptides encoded by tumour-associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence encodes a tumour-associated marigen of the invention. The method comprises performing a global comparison of a group of expressed sequence tags (ESTs) known to be expressed in the phenotype/cell type of interest with all ESTs expressed in normal tissue in order to identify ESTs that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably as a tress or human. The cell type of interest is an abnormal cell such as a tress-induced

The FATP from M. tuberculosis can be used to identify inhibitors which can then be used to treat TB. That from M. grisea (also known as rice blast fungus) can be used to develop anti-fungal agents capable of preventing infection of rice. Those from the human can be used to develop treatments for diabetes, heart disease, obesity, hyperlipidaemia and weight control. The present sequence is one of the sequences described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-SEP-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New secreted and trauseful for treating adhesion disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                        AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide provide specific targeting of bioactive molecules to cells. AAC786987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            08-WAR-1999

The present invention describes an isolated antibody (Ab) that binds to one of the human proteins (P) designated PRO213, PRO1330, PRO1449, PRO377, PRO324, PRO351, PRO362, PRO615, PRO531, PRO538, PRO3644 PRO518, PRO772, PRO773, PRO792 or PRO474. The Ab can be used in compositions and methods for the diagnosis and treatment of neoplastic cell growth and proliferation in mammals, including humans. Genes and polypeptides encoded by them, that are amplified in the genome of a tumour cell, can be identified and are useful targets for the treatment and prevention of certain cancers and may be used to monitor tumour treatment. Compounds that inhibit the expression or activity of the identified polypeptides can be identified and used as antagonists. Benign or malignant tumours, inflammatory disorders and immunological disorders can be treated. and

New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or

Claim 2; Fig 38; 453pp; English

The invention describes an isolated nucleic acid (1) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreaccors. Both are useful in tissue typing. This sequence encodes a novel human secreted and transmembrane PRO polypeptide

New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, for use as pharmaceuticals, diagnostics, biosensors and bioreactors, for identifying modulators of receptor-ligand interactions.

Claim 2; SEQ ID NO 101; 55pp; English.

CC The invention relates to an isolated secreted and transmembrane CC polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful CC in PRO polypeptide detection methods. The PRO polypeptide is useful for CC inking a bioactive molecule to a cell. The PRO polypeptide or an accordance of the PRO polypeptide or an accordance of the PRO polypeptide or an accordance of the PRO polypeptide is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is useful in industrial applications including CC pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is useful for treating disease such as cytokines. The PRO polypeptide is useful for treating disease such as concer e.g. colorectal carcinoma, apoptosis related conditions e.g. AIDS, CC amystrophic lateral sclerosis; inflammatory disease e.g. asthma, cC amystrophic lateral sclerosis; inflammatory disease e.g. Alzheimer's disease, CC amystrophic lateral sclerosis; inflammatory disease e.g. hypertension and CC myocardial ischaemia; kidney disease e.g. renal failure and CC parkinson's disease; cardiovascular disease e.g. hypertension, bronchial asthma, gastrointestinal disorders e.g. gastric ulcer and inflammatory companies and carcinogenesis. The present sequence represents a cDNA central polypeptide of the invention. Note: The sequence data for chis patent did not form part of the printed specification but was cobalance in electronic format directly from USPTO at

The present sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent was obtained in	disorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation	identifying agonists or antagonists. The bloactive molecule maybe a toxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper- or hypo-insulinaemia, cardiac insufficiency, nervous system	polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for

                                                                                               S
                                                                                                                                                                                                                 The invention relates to a new isolated nucleic acid molecule comprises a CC sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 propolypeptides whose sequences are fully defined in the CC specification; or the full length coding sequences fully defined in the CC specification; or the full length coding sequences fully defined in the CC nucleotide sequences. Also included are an isolated PRO polypeptide coding sequence of any these 94 complypeptide sequences cited above (or an isolated PRO polypeptide having CC polypeptide sequence identity to: (a) an amino acid sequence compared to any of the PRO polypeptide with a coding sequence identity to: (a) an amino acid sequence composition; (b) the PRO polypeptide, with a coding its associated signal peptide, or (c) an extracellular domain of the PRO polypeptide, with or CC lacking its associated signal peptide), a vector comprising the nucleic codid molecule, a host cell comprising the vector (and producing a PRO polypeptide, or (c) an extracellular domain of the PRO polypeptide, with or codid molecule, a chimaeric molecule comprising the PRO polypeptide, without a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptide or crossis, anteresting e.g. malignancies or cancers (e.g. ovarian cancer, codetecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, corrosis, atherestility, premature aging, postiasis, inflammatory disease, renal disease, arthritis, immune-mediated alopecia, corrosis, atherestical and the properties or cancers (e.g. ovarian cancer, corrosis, atherestical and particularly as targets for therapeutic intervention in these diseases. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases. The PRO polypeptides are disting and the diagnostic contentification. The pRO genes are useful as hybridisation probes, or for cancer in the properties of human cDNA, genomic DNA or mRNA, The PRO genes may content to the properties of the pro

                                                                                                                                            The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO1559 is useful for detecting PRO725, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule to a cell expressing a PRO493 polypeptide. PRO1559 is useful for linking a bioactive molecule to a cell expressing a PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2003-521814/49.

                                                                                                                                                                                                                                                                     The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO37, PRO1559, PRO7705, PRO700 or PRO739 polypeptide, and for linking a bloactive molecule to a cell expressing the above polypeptides. The bloactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           P-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (GETH )

probable membrane protein YBR041w - yeast (Saccharomyces cerevisiae)
N/Alternate names: hypothetical protein YBR0411
C/Species: Saccharomyces cerevisiae
C/Jate: 26-Aug-1994 #sequence_revision 09-Sep-1994 #text_change 02-Sep-2000
C/Accession: $45899
C/Accession: $45899

DNA Res. 8, 11-22, 2001

A;Title: Complete genome sequence of enterohemorrhag.

A;Reference number: A99629; MUID:21156231; PMID:1125;

A;Accession: H90633

A;Status: preliminary

A;Molecule type: DNA

A;Residues: 1-522 <HAY>

A;Cross-references: GB:BA000007; PIDN:BAB33463.1; PII

A;Experimental source: strain O157:H7, substrain RIMI

A;Gene: caiC
C;Function:
A;Pathway: lysine degradation; tryptophan metabolism
A;Pathway: lysine degradation; tryptophan metabolism
C;Superfamily: 4-coumarate-CoA ligase, acetate-CoA ligase homology
C;Keywords: acid-thiol ligase; ATP; phosphoprotein; transmembrane g;Superfamily: transmembrane #status predicted <TM1>
F;63-521/Domain: transmembrane #status predicted <TM1>
F;81-97/Domain: transmembrane #status predicted <TM2>
F;194/Active site: Lys #status predicted
                                                         RESULT 13
D70806

C;Species: Mycobacterium tuberculosis
C;Species: Mycobacterium tuberculosis
C;Date: 17-Jul-1998 #sequence_revision 17-Jul-1998 #t
C;Accession: D70806
